
Table of Contents

| | | |
|----------|---|-----------|
| 1 | Introduction | 1 |
| 1.1 | What is robustness? | 1 |
| 1.2 | System | 2 |
| 1.3 | Survival | 2 |
| 1.4 | Robustness in structural codes | 2 |
| 2 | The Foreseeable Unforeseen | 5 |
| 2.1 | Ordinary structural design | 5 |
| 2.2 | Shortcomings | 6 |
| 2.3 | Answers from our ancestors | 6 |
| 3 | Survival through Robustness | 9 |
| 4 | The Hazard Scenario | 11 |
| 4.1 | Interior flaws and the like | 11 |
| 4.2 | External causes | 12 |
| 4.3 | The consequence | 14 |
| 5 | Considerations on Hierarchies | 15 |
| 5.1 | The hierarchy of failure modes, targeting quality control | 15 |
| 5.2 | A possible classification of methods | 16 |
| 6 | Elements of Robustness | 19 |
| 6.1 | Strength | 20 |
| 6.2 | Structural integrity and solidarization | 20 |
| 6.3 | Second line of defence | 21 |
| 6.4 | Multiple load path or redundancy | 21 |
| 6.5 | Ductility versus brittle failure | 23 |
| 6.5.1 | Material properties | 26 |
| 6.5.2 | Local weakening (holes, notches, damage corrosion, etc.) | 26 |
| 6.5.3 | Weak connections (weaker than the adjacent elements) | 26 |
| 6.5.4 | Fatigue | 27 |
| 6.5.5 | Instability due to slenderness | 27 |
| 6.6 | Progressive failure versus the zipper stopper | 27 |

| | | |
|-----------|---|-----------|
| 6.7 | Capacity design and the fuse element | 28 |
| 6.8 | Sacrificial and protective devices | 29 |
| 6.9 | The knock-out scenario | 29 |
| 6.10 | Stiffness considerations | 30 |
| 6.11 | The benefits of strain hardening | 33 |
| 6.12 | Post-buckling resistance | 34 |
| 6.13 | Warning, active intervention and rescue | 36 |
| 6.14 | Testing | 38 |
| 6.15 | Monitoring, quality control, correction and prevention | 39 |
| 6.16 | Mechanical devices | 40 |
| 6.17 | Summary | 41 |
| 7 | Maintaining Robustness | 43 |
| 8 | Conclusion | 47 |
| 9 | General Applications | 49 |
| 9.1 | Punching failure of flat plates (strength, ductility, second line of defence) | 49 |
| 9.2 | Unbonded prestress | 50 |
| 9.3 | High-rise buildings, high strength concrete, a difficult case | 52 |
| 9.3.1 | The strength approach | 52 |
| 9.3.2 | Improved ductility | 53 |
| 9.3.3 | Second line of defence | 53 |
| 9.4 | The problem of the corner column (hierarchy of strength) | 54 |
| 9.5 | Thermal deformations, compatibility and tolerance | 56 |
| 9.6 | The collision strut (strength in solidarity) | 59 |
| 9.7 | Façades and curtain walls | 59 |
| 9.8 | Earthquakes and unreinforced masonry (second line of defence) | 62 |
| 9.9 | Assembly of steel structures | 63 |
| 9.10 | Space trusses on point supports (multiple load paths and their problems) | 68 |
| 9.11 | Hanger elements (multiple load path) | 71 |
| 9.12 | Structural glass | 72 |
| 9.13 | Fabric structures | 74 |
| 9.14 | Falsework and scaffolding — a frequent type of failure | 76 |
| 9.15 | Sabotage, how to mitigate its effects | 80 |
| 10 | Examples | 83 |
| 10.1 | Structural integrity of a historic building | 83 |
| 10.2 | A cut-and-cover tunnel in a karst environment | 84 |
| 10.3 | An avalanche gallery subject to train impact | 87 |
| 10.4 | Columns placed behind buffers (knock-out versus protective element) | 91 |
| 10.5 | The case of a cable-stayed bridge | 91 |
| 10.6 | Power lines | 93 |
