1	Introduction	9
2	The Stein-Chen method	17
2.1	Poisson approximation of the binomial distribution	17
2.2	Distances between probability measures	21
2.3	Le Cam's result for Poisson approximation	24
2.4	The Stein-Chen method for Poisson approximation	27
2.4.1	Construction of the Stein equation and smoothness estimates	30
2.4.2	Independent indicator variables	31
2.4.3	Dependent indicator variables – The local approach	33
2.4.4	The antisymmetric function approach	35
2.4.5	Immigration-death processes and the generator interpretation	37
2.5	Poisson process approximation in the total variation distance	40
2.5.1	Point process	41
2.5.2	Poisson process	43
2.5.3	Palm processes and Janossy densities	44
2.5.4	Approximation of point processes – the generator interpretation	46
2.5.5	Approximation of point processes with i.i.d. marks – Michel's argument	59
2.6	Improved rates for Poisson process approximation using the d_2 -distance	61
3	Poisson and Poisson process approximation for univariate extremes	77
3.1	Poisson approximation for the number of extreme points and maxima of random variables	77
3.1.1	Maxima of continuous random variables	83
3.1.2	The problem for maxima of discrete random variables	95

3.1.3	Maxima of discrete random variables	99
3.2	Poisson process approximation for MPPE's	105
3.2.1	Application to MPPE's with continuous marks	109
3.2.2	Application to MPPE's with geometric marks	116
3.2.3	Remarks on the choice of the point process and its approximation by a Poisson process	121
4	Poisson process approximation for multivariate extremes	123
4.1	Copulas and tail dependence	128
4.1.1	Definition and properties of copulas	128
4.1.2	Fréchet-Hoeffding bounds	130
4.1.3	Sklar's Theorem	131
4.1.4	Survival copulas	132
4.1.5	Absolutely continuous and singular components of copulas	134
4.1.6	Coefficients of tail dependence	136
4.2	Poisson process approximation for MPPE's with multivariate marks	137
4.2.1	Joint threshold exceedances	138
4.2.2	Single-component threshold exceedances	142
4.2.3	An example of hidden dependence for joint threshold exceedances	148
4.3	Archimedean copulas with upper tail dependence	150
4.3.1	An asymptotic result	153
4.3.2	Approximation in d_{TV} by a Poisson process	155
4.3.3	Examples	167
4.3.4	Higher dimensions	174
4.4	MPPE's with bivariate Marshall-Olkin geometric marks	178
4.4.1	The bivariate Marshall-Olkin geometric distribution	179
4.4.2	Approximation in d_{TV} by a Poisson process on a lattice	181
4.4.3	Construction of a "continuous" intensity function	183
4.4.4	Assumptions on the distributional parameters	188
4.4.5	Approximation in d_2 by a Poisson process with continuous intensity	191
4.4.6	Approximation in d_2 and d_{TV} by a Poisson process independent of n	199
4.4.7	Final bound in the d_2 -distance	204
