Abstract	vii
Zusammenfassung	ix
Dissertation Structure	xi
Summary of Contributions	xi
List of Figures	xiv
List of Tables	xv
List of Acronyms	xvi
I Introduction	1
1 Introduction	3
1.1 Motivation	3
1.1.1 The growth of intermittent renewable energy	3
1.1.2 Increasing reserve requirements	4
1.1.3 Electricity market practice	7
1.1.4 Online optimization for power systems	9
1.2 Sources of uncertainty in power systems	12
1.2.1 Consumption	13
1.2.2 Intermittent renewables	13
1.2.3 Contingencies	15
1.3 Literature survey	16
1.3.1 Optimal Power Flow	16

1.3.2	Robust optimization with recourse	18
1.3.3	Distributed optimization and pricing mechanisms	19
1.3.4	Novel electricity pricing mechanisms	22
II	Policy-Based Reserves for Power Systems	25
2	Affine Reserve Policies	27
2.1	Introduction	28
2.2	Power system model	30
2.2.1	Participant model	30
2.2.2	Network model	33
2.3	Optimal affine reserve policies	34
2.3.1	Finite horizon optimization	35
2.3.2	Equivalent tractable reformulation	37
2.3.3	Computational requirements	40
2.4	Numerical case study	41
2.4.1	System model	41
2.4.2	Uncertainty model	42
2.4.3	Comparison of reserve costs	45
2.4.4	Sensitivity analysis	47
2.5	Discussion	48
3	Implementation of Affine Reserve Policies	51
3.1	Market incorporation	51
3.1.1	Efficient reserve policy prices	53
3.1.2	Policy-based reserve products	55
3.1.3	Clearing mechanisms	56
3.1.4	Real time operation	58
3.1.5	Decision-making process	60
3.2	Technical incorporation	60
3.2.1	Existing control structure	62
3.2.2	Adapting AGC to implement the first step of a reserve sequence	63
3.2.3	Adapting tertiary reserves to implement the remaining steps of a reserve sequence	65
4	Extensions	67

4.1	An MLD recourse formulation of robust unit commitment	67
4.1.1	Problem reformulation	68
4.1.2	Numerical example	72
4.1.3	Discussion	75
4.2	Large-scale solutions using ADMM	81
4.2.1	Application to the unit commitment problem	85
4.3	Double-sided reserves	85

III Distributed Optimal Power Flow and Market Mechanisms 87

5 Distributed Solutions to Welfare Maximization Problems 89

5.1	Welfare maximization problems	89
5.1.1	Problem statement	90
5.1.2	Elastic and inelastic supply and demand	90
5.1.3	The central planner's solution	91
5.1.4	Profit maximization and price coordination	91
5.1.5	Pricing in the absence of (strict) convexity	93
5.2	Solution mechanisms	96
5.2.1	Double-sided auction	96
5.2.2	Iterative pricing mechanisms	97

6 Multi-Period Optimal Power Flow 105

6.1	A dual ascent mechanism for solving multi-period OPF	105
6.1.1	Problem statement	106
6.1.2	Market-based solution	109
6.1.3	Modified algorithms for improved performance	114
6.1.4	Results	118
6.1.5	Further improvements	124
6.1.6	Conclusions	125
6.2	Receding horizon (rolling window) electricity market	127
6.2.1	Comparison with Economic MPC	128
6.2.2	Negotiated predictive dispatch	129
6.2.3	Conclusion	131

IV	Research Outlook	133
7	Short- and Medium-Term Objectives	135
7.1	Affine reserve policies	135
7.2	Online decision-making tools	137
7.3	ADMM for large-scale combinatorial optimization problems relevant to power systems	138
7.4	Pricing mechanisms	138
7.5	AC optimal power flow	139
8	Long-Term Challenges	141
8.1	Business as usual	141
8.2	Sharing costs and profits at high renewable penetration	142
	Appendix: DC load flow approximation	145
	Bibliography	147
	Publication List	159
	Curriculum Vitae	161
