Abstract (English/Français)	iii
List of figures	xi
List of tables	xv
List of Abbreviations	xvii
1 Introduction	1
1.1 Fundamentals of remote sensing	1
1.2 Bio-and geo-physical parameters estimation	5
1.2.1 Importance of land parameters monitoring	5
1.2.2 Principles and main obstacles in land parameters estimation	6
1.3 Retrieval process	8
1.3.1 Experimental vs. model based approaches	9
1.4 State-of-the-art in soil moisture retrieval	10
1.4.1 Approaches based on optical data for soil moisture retrieval	10
1.4.2 SAR Models for soil moisture retrieval	13
1.5 Motivations, goals and novel contributions of the thesis	17
1.5.1 Main reasons to exploit synergy of optical and SAR remote sensing .	17
1.5.2 Thesis goals	18
1.5.3 Motivations	18
1.5.4 Novel contributions of the thesis	19
1.5.5 Thesis structure	24
2 Direct models and retrieval techniques used in the thesis	27
2.1 Fundamentals of optical remote sensing	27
2.2 Introduction to microwave modeling	30
2.2.1 General aspects of scattering models	31

2.2.2	Scattering models - Overview	32
2.3	“Tor Vergata” scattering model	34
2.3.1	Single scatter	36
2.3.2	Sublayer characterization	37
2.3.3	Soil scattering	39
2.3.4	Matrix doubling algorithm	39
2.3.5	Backscattering coefficient calculation	40
2.4	Methods for bio-and geo-physical parameters retrieval	40
2.4.1	Principles of kernel methods	42
2.4.2	Standard kernels	42
2.4.3	Support Vector Regression	42
2.4.4	Gaussian Process Regression	44
2.5	Conclusions	46
3	Estimation of soil moisture in bare soils from hyperspectral imagery with Support Vector Regression	49
3.1	Introduction and motivation	49
3.2	Dataset description and experiment design	51
3.2.1	Hyperspectral data	52
3.2.2	Field sampling	52
3.2.3	Soil moisture properties of the sampling fields	53
3.3	ν -SVR design	54
3.4	Results and discussion	54
3.5	Conclusions	56
4	Vegetation height and leaf area index retrieval from hyperspectral images	57
4.1	Introduction and motivation	57
4.2	Dataset description and experiment design	58
4.2.1	Hyperspectral data	59
4.2.2	Field sampling	60
4.2.3	ν -SVR design	61
4.3	Results and discussion	62
4.4	Conclusions	62
5	Joint use of SAR discrete model and kernel algorithm in soil moisture estimation in crop fields	65
5.1	Introduction and motivation	65
5.2	Experimental dataset	67
5.2.1	Vegetation and soil sampling	67
5.2.2	E-SAR flights	69
5.2.3	Experimental setup	70
5.3	“Tor Vergata” model for AgriSAR2006	70
5.4	Backscattering simulations results	72
5.5	Soil moisture retrieval	74
5.6	Conclusion	79

6 Synergy of optical and radar data in soil moisture estimation in Alpine areas using coupled SAR discrete model and kernel regressor	81
6.1 Introduction and motivation	81
6.2 Experimental dataset	83
6.2.1 ASAR dataset	83
6.2.2 Leaf area index (LAI)	85
6.2.3 Digital Elevation Model	85
6.2.4 Precipitation	85
6.2.5 Soil moisture measurements	86
6.3 “Tor Vergata” model for Alpine grass	87
6.4 Backscattering simulations results	89
6.5 Soil moisture retrieval	91
6.6 Conclusion	97
7 Synergy of multi-sensor observations in soil moisture retrieval in mountain areas	99
7.1 Introduction and motivation	99
7.2 Experimental datasets	100
7.2.1 ASAR images	100
7.2.2 Optical data	102
7.2.3 Solar radiation	103
7.2.4 Digital Elevation Model	104
7.2.5 Rain events and irrigation	105
7.2.6 Soil moisture measurements	105
7.2.7 Land cover map	106
7.3 Retrieval of soil moisture by Gaussian Process Regression	106
7.4 Conclusions	112
8 Conclusions	115
8.1 Summary and discussion	115
8.2 Final remarks and future developments	118
8.3 Recent and future sensors and missions relevant to bio/geophysical parameter retrieval and land monitoring	119
List of Publications	125
A An appendix - Hybrid approach for the retrieval of soil moisture from SAR data	127
A.1 Principles of hybrid approach	127
A.2 Dataset used in hybrid approach	129
A.3 Backscattering coefficients simulated by “Tor Vergata”	133
A.4 Results of hybrid approach	136
Bibliography	160
Curriculum Vitae	161
