Introduction	1
Organization of this Thesis	1
Publication Statement	1
1 Key concepts and models	5
1.1 The principle of small-signal amplification	5
1.1.1 Dynamical systems	5
1.1.2 Bifurcations	5
1.1.3 Small-signal amplification	6
1.1.4 The Hopf amplifier	6
1.2 Small-signal amplification in vertebrates and insects	8
1.2.1 Vertebrates	9
1.2.2 Insects	9
1.3 The mammalian cochlea	11
1.3.1 Physiology of the mammalian cochlea	11
1.3.2 Basilar membrane motion	13
1.4 The Hopf cochlea model	15
1.4.1 The model by Kern and Stoop	15
1.4.2 Simplification and analog electronic implementation	18
1.5 A full model of the peripheral auditory system	19
1.5.1 Inner hair cells	20
1.5.2 Auditory nerve neurons	20
1.5.3 Compound model	23
2 Cochlear complexity	27
2.1 Response to single tones	27
2.1.1 Activation profiles	29
2.2 Response to two tones: combination tones	29
2.2.1 Response of a single Hopf oscillator	30
2.2.2 Response of the full Hopf cochlea	33

2.2.3	Activation profiles	36
2.3	Response to mixtures of complex tones	37
2.3.1	Cochlear interaction networks	38
2.4	Statistical activation properties	41
2.4.1	Activation statistics	41
2.4.2	Network statistics	42
2.4.3	The effect of learning	43
2.4.4	Interpretation	45
3	Pitch and the tuning of the cochlea	49
3.1	Pitch	49
3.1.1	Basic notions	49
3.1.2	The missing fundamental paradigm	50
3.1.3	Pitch-shift experiments	50
3.1.4	Discussion	59
3.2	Cochlear tuning	60
3.2.1	The medial olivocochlear (MOC) system	60
3.2.2	Simple MOC effects	61
3.2.3	A pitch-based measure for focusing on sounds	62
3.2.4	A full feedback system	63
3.2.5	Discussion	64
3.3	Conclusions	67
	Bibliography	69
	Curriculum Vitae	78
	List of Publications	79
