

Table of Contents

Abstract1

Introduction2

 Listeriosis.....2

Listeria monocytogenes as a pathogen3

 Pathogenesis of (rhomb)encephalitis.....5

 Genetic variability of *Listeria monocytogenes*7

 Aim and strategy9

Results10

Listeria monocytogenes spreads within the Brain by Actin-Based Intra-Axonal Migration.....10

Listeriolysin S, *internalin F* and *internalin J* and are not involved in the hypervirulence of *L. monocytogenes* CC128

 Supplementary data concerning Internalin J (InIJ)44

 A naturally occurring *prfA* truncation in a *Listeria monocytogenes* field strain contributes to reduced replication and cell-to-cell spread58

Discussion.....73

 Role of ActA in rhombencephalitis74

 Roles of *inlF*, *inlJ* and *llsB* in hypervirulence75

 Discovery of a previously unknown PrfA truncation76

 Outlook.....77

References (Introduction and Discussion)78

Curriculum Vitae.....85
