

Contents

1	Introduction	1
1.1	Clinical Background	2
1.1.1	Total Knee Replacement	3
1.2	Patient-Specific FE Models	6
1.2.1	Extracting Bone Anisotropy <i>in vivo</i>	8
1.2.2	Statistical Models of Bone for FE Analysis	12
1.3	Thesis Objectives	14
2	Biomechanical Role of Bone Anisotropy Estimated on Clinical CT Scans by Image Registration	17
2.1	Introduction	18
2.2	Materials and Methods	18
2.2.1	Datasets	19
2.2.2	Extracting Material Properties	20
2.2.3	Image Registration	22
2.2.4	Mechanical Simulations	26
2.3	Results	32
2.3.1	Image Registration	32
2.3.2	Mechanical Simulations	34
2.3.3	Proximal Femur	34
2.4	Discussion	38
3	Patient-Specific Patella Model for TKA Patients	41
3.1	Introduction	42
3.2	Material and Methods	43
3.2.1	TKA Patients and Input Data	43
3.2.2	Patient-specific TKA Model	44
3.2.3	Result Analysis	46
3.3	Results	47

3.4 Discussion	50
4 Statistical Model of Bone Biomechanics	53
4.1 Introduction	54
4.2 Materials and Methods	55
4.2.1 Dataset	55
4.2.2 Establishing Correspondences	55
4.2.3 Material Properties	56
4.2.4 Statistical Models	57
4.2.5 Model Evaluation	60
4.2.6 FE Simulations	62
4.3 Results	63
4.3.1 Model Evaluation	63
4.3.2 Mechanical Simulation Results	65
4.4 Discussion	67
5 Fast Prediction of Femoral Biomechanics Using Supervised Machine Learning and Statistical Shape Modeling	71
5.1 Introduction	72
5.2 Materials and Methods	73
5.2.1 Dataset and Tools	73
5.2.2 Finite Element Prediction (<i>FEP</i>) Framework	76
5.2.3 <i>FEP</i> for X-ray images.	78
5.3 Results	78
5.3.1 Results of <i>FEP</i> for CT Scans	78
5.3.2 Results of <i>FEP</i> for X-ray Images	80
5.4 Conclusion and Discussion	80
6 Conclusion and Outlook	85
A Parameters file for elastix	91
Bibliography	95
