Abstract	i
Sommario	v
Acknowledgements	ix
Published contents	xv
1 Introduction	1
1.1 Motivation and background	2
1.2 Dynamics of particulate systems	5
1.3 Tunable phononic metamaterials	6
1.4 Topological phononic metamaterials	8
1.5 Thesis outline	10
2 Impact propagation and absorption in two-dimensional dense colloidal monolayers	13
2.1 Introduction	14

2.2	Experimental methods	15
2.2.1	Preparation and characterization of colloidal monolayers	15
2.2.2	Friction between particle and glass substrate	18
2.2.3	Experimental setup and pulsed laser ablation	18
2.3	Numerical methods	21
2.3.1	Strain-wave simulations in monolayers with controlled disorder	26
2.4	Results and discussions	31
2.4.1	Laser power dependence	33
2.4.2	Comparison between experimental and numerical results	33
2.4.3	Viscosity dependence	36
2.4.4	Stress propagation mechanisms	38
2.4.5	Effects of local disorders	38
2.5	Conclusion	40
2.6	Appendix	41
2.6.1	Data processing	41
3	Nonlinear phononics with one-dimensional nanoelectromechanical lattices	43
3.1	Introduction	44
3.1.1	Device structures	46
3.2	Analytical and numerical methods	48
3.2.1	Discussion on frequency tuning mechanisms	48
3.2.2	Effective gap distance for electrostatic force model	51
3.2.3	Numerical simulations	52
3.2.4	Analytical model for frequency dispersion	53
3.3	Experimental methods	60
3.3.1	Sample fabrication	60
3.3.2	Experimental setups	61
3.3.3	Measurement of frequency dispersion	63
3.3.4	Measurement of group velocity	64

3.4	Results and discussions	66
3.4.1	Tunable phononic band gap	66
3.4.2	Tunable group velocity	69
3.4.3	Dynamic modulation and nonlinear band gap	71
3.5	Conclusion	73
3.6	Appendix	74
3.6.1	Effects of lattice spacing	74
3.6.2	Effects of the number of unit cells	75
3.6.3	Discussion on dynamic modulation	76
3.6.4	Perturbation theory for nonlinear band gap	80
4	Phononic topological insulators with two-dimensional nanoelectromechanical lattices	85
4.1	Introduction	86
4.2	Analytical methods	88
4.2.1	Discrete element model	88
4.2.2	Dispersion relation of graphene honeycomb lattice	89
4.2.3	Dispersion relation of extended honeycomb lattice	92
4.2.4	Brillouin zone folding mechanisms and double Dirac-cone	94
4.2.5	Topological band gap and band inversion at Γ point	95
4.2.6	Brief discussion on topological properties	101
4.2.7	Spin-Chern number in the extended honeycomb lattice	105
4.3	Experimental realization	108
4.3.1	Fabrication strategy for topological nanoelectromechanical lattices	108
4.3.2	Finite element model for topological phase transition and edge states	110
4.3.3	Characterizations of topological edge waveguides	117
4.3.4	Characterizations of the robustness against distortions and defects	121
4.4	Conclusion	122

5 Summary, conclusion and future works	123
5.1 Summary and conclusion	123
5.2 Future works	124
Bibliography	127
