<b>1</b>	<b>Introduction</b>	<b>1</b>
1.1	Structure of this thesis . . . . .	1
1.2	Heart failure . . . . .	3
1.2.1	Heart failure is a global epidemic . . . . .	3
1.2.2	Acute heart failure is a fatal condition . . . . .	3
1.3	Treatment options . . . . .	4
1.3.1	The development of mechanical circulatory support systems . . . .	4
1.3.2	Continuous-flow ventricular assist devices offer better functionality at smaller sizes . . . . .	5
1.3.3	Towards ventricular assist devices as destination therapy . . . . .	6
1.3.4	Problems of current systems . . . . .	6
1.3.5	Thrombosis, bleeding and stroke are consequences of blood-device interface interactions . . . . .	7
1.4	The Zurich Heart project . . . . .	8
1.5	The Alternative Systems Approach . . . . .	9
1.5.1	The new concept of a fully endothelialized VAD . . . . .	9
1.5.2	The hybrid membrane project . . . . .	11
1.6	Cell biological and molecular aspects . . . . .	12
1.6.1	The endothelium . . . . .	12

<b>2 A novel Bioreactor for the assessment of Endothelialization on Deformable Surfaces</b>	<b>15</b>
2.1 Introduction	16
2.1.1 A perspective on substrate endothelialization	16
2.1.2 Past test systems and their capabilities	17
2.1.3 Towards a combined system capable of high WSS levels	18
2.2 Materials and Methods	19
2.2.1 Fabrication and actuation	19
2.2.2 Fabrication of the deformable membrane	20
2.2.3 Optical transparency	20
2.2.4 Cell culture	21
2.2.5 Substrate endothelialization	21
2.2.6 Immunostaining	22
2.2.7 Image acquisition	22
2.2.8 Image analysis	23
2.2.9 Finite Element Model	23
2.2.10 Digital image correlation	23
2.2.11 Computational Fluid Dynamics model	24
2.2.12 Micro Particle Image Velocimetry	25
2.2.13 Statistical analysis	26
2.3 Results	26
2.3.1 Working Principle of the reactor system	26
2.3.2 Design and operation	26
2.3.3 Control and Validation	28
2.3.4 Assessment of endothelialization	35
2.4 Discussion	40
<b>3 Towards a surface engineering approach for endothelial cell retention</b>	<b>45</b>

<b>4 Adaptive Nesting of endothelial cells in honeycomb-structured biomedical metasurfaces</b>	<b>49</b>
4.1 Introduction	49
4.1.1 A new approach for sustaining endothelialization	49
4.2 Results	50
4.2.1 A hexagonal tiling compartmentalizes the endothelial layer	50
4.2.2 CFD simulations reveal a reduction of WSS due to the topography	51
4.2.3 A rational choice for well depth is chosen based on EC coverage	53
4.2.4 The microtexture retains the cells in a proliferative state	53
4.2.5 The microtexture confers resistance to superphysiological WSS	55
4.2.6 The microtexture prevents the expansion of wounds	57
4.2.7 The subcellular rearrangement corresponds to WSS patterns	59
4.2.8 Inflammatory marker analysis shows a protective effect of the microtexture	59
4.2.9 Extension and application of the microtexture to soft substrates	65
4.2.10 Conclusions	72
4.3 Materials and Methods	72
4.3.1 Substrate fabrication	72
4.3.2 Cell Culture	73
4.3.3 Proliferation assay	74
4.3.4 Dynamic conditioning of Endothelial Cells	74
4.3.5 Cell staining	75
4.3.6 Image Acquisition	76
4.3.7 Image Analysis	77
4.3.8 Scanning electron microscopy (SEM)	78
4.3.9 Computational fluid dynamics (CFD) simulations	78
4.3.10 Statistics	79

<b>5</b>	<b>Conclusions and Outlook</b>	<b>81</b>
5.1	Two important milestones pave the way for future research . . . . .	81
5.2	Extending the microtexture to RTV . . . . .	82
5.3	Merging gratings with the honeycomb structure . . . . .	83
5.4	Selective strain redistribution for enhanced retention . . . . .	85
5.5	Evaluation of other interlayer solutions might reveal promising alternatives	90
5.6	Transferring the topography to a VAD sized membrane . . . . .	90
5.7	Towards clinical integration . . . . .	91
5.8	Closing remarks . . . . .	91
	<b>Appendix</b>	<b>95</b>
