

Table of contents

Summary	vi
Zusammenfassung	x
1 Introduction	1
1.1 Assessment of contaminants fate using compound specific isotope analysis	2
1.1.1 Lack of selectivity in sample preparation	3
1.2 Molecular imprinting in environmental analytical chemistry	5
1.2.1 Strategies for application to CSIA	6
1.3 Objectives and approach	8
2 Synthesis, assessment, and application of molecularly-imprinted polymers for $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ measurements of 1<i>H</i>-benzotriazole in aquatic environments	11
2.1 Introduction	12
2.2 Experimental section	13
2.2.1 Safety considerations	13
2.2.2 Synthesis of molecularly-imprinted polymers	14
2.2.3 Sample preparation procedures using MISPE	15
2.2.4 Isotope fractionation experiments	18
2.2.5 Chemical and stable-isotope analyses	18
2.2.6 Data evaluation	20
2.3 Results and Discussion	22
2.3.1 Isotope analysis of 1 <i>H</i> -benzotriazole after selective cleanup from spiked river water	22
2.3.2 Quantitative evaluation of imprinting efficiency	24
2.3.3 Isotope fractionation from incomplete analyte recovery	26
2.3.4 Application in waste water treatment plants	27
2.4 Conclusion	31
Supporting Information to Chapter 2	32
S2.1 Chemicals	34
S2.2 Dishwasher detergents	35

S2.3 Field site and sampling	35
S2.4 Reactor for synthesis of molecularly-imprinted polymers	37
S2.5 Derivations of interaction enthalpies for assessment of molecularly-imprinted polymers	38
3 Impact of natural organic matter on $\delta^{13}\text{C}$ of triazines analyzed by offline molecularly - imprinted solid-phase extraction coupled to gas chromatography / isotope-ratio mass spectrometry	39
3.1 Introduction	40
3.2 Experimental section	41
3.2.1 Chemical and materials	41
3.2.2 Sample preparation of matrix from river organic matter	42
3.2.3 Molecularly-imprinted solid-phase extraction	42
3.2.4 Experiments	44
3.2.5 Chemical and isotope analysis	45
3.3 Results and discussion	47
3.3.1 Matrix-dependent limits of GC/IRMS and MISPE	47
3.3.2 Integrity of $\delta^{13}\text{C}$ and $\delta^{15}\text{N}$ for atrazine and desethyl-atrazine after MISPE	49
3.3.3 Implications to whole sample preparation workflows for CSIA	51
3.4 Conclusion	53
Supporting Information to Chapter 3	55
S3.1 Chemicals	56
S3.2 Materials	56
S3.3 Method quantification limit of GC/IRMS	57
4 Matrix effects associated with direct enrichment of glyphosate and AMPA from natural waters on water-compatible molecularly-imprinted polymer	59
4.1 Introduction	60
4.2 Experimental section	63
4.2.1 Reagents, standards, and sorbents	63
4.2.2 Sample preparation	63
4.2.3 IC-ESI-MS/MS	64
4.2.4 LC/IRMS	68
4.2.5 Experiments	68
4.3 Results and discussion	72
4.3.1 Bleed matrix effects on quantification	72
4.3.2 Sample matrix effects on quantification	75
4.3.3 Performance of optimized method MISPE-IC-ESI-MS/MS	76

4.3.4 Bleed matrix effect and HCl effect on carbon-isotope ratio measurements	78
4.4 Conclusion	81
Supporting Information to Chapter 4	84
S4.1 Gradient program for ion chromatography	86
S4.2 Conditions for tandem MS analysis	86
S4.3 Characteristic parameters of the environmental waters	87
S4.4 Instrumental detection- and quantification limits of glyphosate and AMPA on IC-ESI-MS/MS	88
S4.5 Procedures of preconditioning the MISPE cartridges	89
S4.6 Correlation of first- versus total-carryover	90
S4.7 Measurements of dissolved-organic carbon	90
5 Conclusions and Outlook	91
5.1 Effectiveness and limitations of molecular-imprinting approaches for CSIA	92
5.2 Implications for other contaminants	94
Bibliography	96
Curriculum Vitae	114
