

Contents

1	A signal separation technique for sub-cellular imaging using dynamic optical coherence tomography	1
1.1	Introduction	1
1.2	The dynamic forward problem	2
1.2.1	Single particle model	2
1.2.2	Multi-particle dynamical model	4
1.3	Property analysis of the forward problem	6
1.3.1	Direct operator representation	6
1.3.2	Eigenvalue analysis	8
1.4	The inverse problem: Signal separation	11
1.4.1	Analysis of the SVD algorithm	11
1.4.2	Analysis of obtaining the intensity of metabolic activity	14
1.5	Numerical experiments	16
1.5.1	Forward problem measurements	16
1.5.2	SVD of the measurements	17
1.5.3	Selection of cut-off singular value	18
1.5.4	Signal reconstruction	21
1.5.5	Discussion and observations	21
1.6	Conclusion	22
1.7	Appendix: Non-orthogonality of the eigenvectors of F_{cc} , F_{cm} , and F_{mc}	23
2	Mathematical Analysis of Ultrafast Ultrasound Imaging	25
2.1	Introduction	25
2.2	The Static Forward Problem	26
2.3	The Static Inverse Problem	29
2.3.1	Beamforming	29
2.3.2	The PSF	30
2.3.3	Angle compounding	35
2.4	The Dynamic Forward Problem	36
2.4.1	The quasi-static approximation and the construction of the data	36
2.4.2	The Doppler effect	36
2.4.3	Multiple scatterer random model	38
2.5	The Dynamic Inverse Problem: Source Separation	40
2.5.1	Formulation of the dynamic inverse problem	40
2.5.2	The SVD algorithm	40

2.5.3	Justification of the SVD in one-dimension	41
2.6	Numerical Experiments	43
2.7	Concluding Remarks	50
2.8	Appendix: The Justification of the Approximation of the PSF	50
3	Dynamic spike super-resolution and applications to Ultrafast ultrasound imaging	53
3.1	Introduction	53
3.2	Setting the stage	55
3.2.1	The space-velocity model	55
3.2.2	The perfect low-pass case	57
3.3	Exact recovery in absence of noise	58
3.3.1	Dual certificates	58
3.3.2	Main result	61
3.3.3	Comments on the hypotheses of Theorem 3.3.2	62
3.4	Other constructions of dynamical dual certificates	66
3.4.1	Dual certificates with no static separation condition	66
3.4.2	Dual certificates in presence of ghost particles	67
3.5	Stable reconstruction with noise	69
3.6	Numerical simulations	72
3.6.1	Methods	72
3.6.2	The measurements	72
3.6.3	Results	73
3.7	Applications to ultrafast ultrasonography	76
3.7.1	Fully automated imaging protocol	77
3.7.2	Numerical experiments	77
3.8	Conclusion	79
4	Heat generation with plasmonic nanoparticles	81
4.1	Introduction	81
4.2	Setting of the problem and the main results	82
4.3	Layer potentials for the Helmholtz equation in two dimensions	85
4.4	Heat generation	86
4.4.1	Small volume expansion of the inner field	87
4.4.2	Small volume expansion of the temperature	91
4.4.3	Temperature elevation at the plasmonic resonance	95
4.4.4	Temperature elevation for two close-to-touching particles	97
4.5	Numerical results	97
4.5.1	Single-particle simulation	98
4.5.2	Two particles simulation	102
4.6	Concluding remarks	104
4.7	Appendix: Asymptotic analysis of the single-layer potential in two dimensions	105
4.7.1	Layer potentials for the Laplacian in two dimensions	106
4.7.2	Asymptotic expansions	111
