Contents

1 Photosensing in biomedical research and diagnosis **1**

1 Using light in biomedical research and care 1

1.1 Photoplethysmography and pulse oximetry 1

1.2 Fluorescence, chemoluminescence, and bioluminescence 1

1.3 Practical use of fluorescence and chemoluminescence 3

2 Semiconductor photosensors 5

2.1 Optical absorption and free carriers production 5

2.2 The *p-n* and *p-i-n* photodiodes 6

2.3 Avalanche photodiodes (APDs) 8

2.4 Single-photon avalanche diodes (SPADs) 9

2.5 Phototransistors 11

2.6 Active-Pixel Sensors (APSs) and Charge-Coupled Devices (CCDs) 12

2.7 Hybrid MOS-PN photodector 15

3 Noise 16

3.1 White noise 16

3.2 Low-frequency noise 19

Conclusions 23

2 Digitizing the photocurrent **25**

1 Target application 25

1.1 Concept 25

1.2 Feasibility 26

2 Charge integration with subsequent digitization 28

2.1 Charge integration 28

2.2 Sampling strategies 29

2.3 Voltage quantization 31

3 Current-to-frequency conversion of the photocurrent 32

3.1 Current-controlled oscillators (CCO) 32

3.2 First-order $\Sigma\Delta$ converters 33

3.3 Imperfections in these current-to-frequency converters . . . 36
Conclusions . . . 54

3 Impact of noise in a continuous-time integrator-based ADC 55
1 A required work . . . 55
2 Variance of a single measurement . . . 56
3 Considering a calibrating measurement . . . 58
4 Understanding the weighting function $\mathcal{W}(\omega)$ . . . 59
4.1 About the terms that constitute $\mathcal{W}(\omega)$ . . . 59
4.2 Geometrical representations for $\mathcal{W}(\omega)$ . . . 61
4.3 The case of many measurements . . . 62
5 Practical formulas for typical noises . . . 64
5.1 White noise . . . 64
5.2 Lorentzian noise . . . 65
5.3 Flicker noise . . . 68
6 About the used hypothesis . . . 69
6.1 On the random delays hypothesis . . . 69
6.2 On the stationary noise hypothesis . . . 74
7 The practical case of a single transistor . . . 78
8 From a pair of measurements to any combination of measurements . . . 81
Conclusions . . . 82

4 Practical implementation of the error estimation 85
1 Computation issues . . . 86
2 A proper implementation for the formulas established in chapter 3 . . . 87
2.1 For Lorentzian noise . . . 87
2.2 For Flicker noise with a frequency exponent $EF = 1$ . . . 90
2.3 For Flicker noise with a frequency exponent $EF \neq 1$ . . . 96
2.4 Overall implementation in the case of a Flicker noise . . . 104
3 Implementing for the general case . . . 105
3.1 Definition of the problem . . . 105
3.2 The issue with $|H(j\omega)|^2$ . . . 105
3.3 Working around in the case of a low-pass filtered Flicker noise . . . 107
3.4 Transforming $\mathcal{W}(\omega)$ . . . 108
3.5 Handling $|H(j\omega)|^2$ once $\mathcal{W}(\omega)$ has been replaced . . . 119
Conclusions . . . 124

5 A top-down tool-assisted design strategy 127
1 Design strategy . . . 127
2 A suited tool for exploring design choices . . . 128
2.1 The needs . . . 128
2.2 Proposed solution . . . 128
3 A tool for parameterized simulations using multiple softwares . . . 131
3.1 The need . . . 131
3.2 A configurations tree . . . 132
3.3 Parameterized text files and commands . . . 132
3.4 Adding cases, getting results . . . 133
Conclusions . . . 134

6 Looking beyond the electronics: the case of heart-rate monitoring 135
1 Photoplethysmography . . . 135
2 Power consumption: an insurmountable limit . . . 137
3 Algorithms for heart rate monitoring . . . 137
4 Reducing the sample rate . . . 139
4.1 Peak localization with a low sampling rate . . . 139
4.2 Identifying the systolic peaks . . . 140
4.3 A prototype algorithm . . . 143
4.4 Acquiring a photoplethysmograph with the hybrid MOS-PN photodiode . 144
Conclusions . . . 145

7 Conclusion 147
1 Summary . . . 147
2 Contributions . . . 148
3 Outlook . . . 148

Appendices 151

A Demonstrations of the impact of different noise types 153
1 Starting formulas . . . 153
2 Computing the effect of white noise . . . 154
3 Computing the effect of Lorentzian noise . . . 155
4 Computing the effect of flicker noise . . . 155
4.1 When the frequency exponent is 1, and $T > \frac{\tau_c+\tau}{2}$ . . . 155
4.2 When the frequency exponent is 1, and $T = \frac{\tau_c+\tau}{2}$ . . . 156
4.3 When the frequency exponent is not 1 . . . 158

B Confirmatory transient analysis of non-stationary random processes **159**

1 The case of a Lorentzian noise 159

2 The case of a 1/f noise 161

C Matlab functions for computing the impact of noise **165**

D Useful integrals and primitives **171**

1 Formulas for $\int_0^\infty (1+(\frac{\omega}{p})^2)^{-n}\,(\frac{\sin(a\,\omega)}{\omega})^2\,\mathrm{d}\omega$, with $a \in \mathbb{R}^{*+}$, $p \in \mathbb{R}^{*+}$, $n \in [1..5]$ . . . 171

2 Computing $\int x^k/(1+(\frac{x}{p})^2)\,\mathrm{d}x$, with $p \in \mathbb{R}^{*+}$, $k \in \mathbb{Z}$ 171

3 Computing $\int x^\alpha/(1+(\frac{x}{p})^2)\,\mathrm{d}x$, with $p \in \mathbb{R}^{*+}$, $\alpha \in \mathbb{R}\backslash\mathbb{Z}$ 172

E Piecewise polynomial approximations of trigonometrical functions **175**

1 Polynomial approximations for $\sin(\frac{x\,\pi}{2})$ and $\sin(\frac{x}{2})$ 175

2 Polynomial approximations for $\sin(\frac{x\,\pi}{2})^2$ and $\sin(\frac{x}{2})^2$ 177

F Complements on the piecewise approximation of $x \mapsto \frac{1}{1+x}$ **181**

1 Optimal approximation of $\frac{1}{1+x}$ as $\frac{1}{1+x} \simeq B\,x^{-A}$ on $[x_0, x_1] \subset \mathbb{R}^+$ 181

2 Initial segmentation of $\mathbb{R}^+$ when looking for a piecewise approximation of $\frac{1}{1+x}$ . . 182

3 Refining a segmentation of $\mathbb{R}^+$ for a piecewise approximation of $\frac{1}{1+x}$ 184

G Use of the Python tool for parameterized simulations **187**

1 Parameterized files 187

1.1 Declaring the parameters and results 187

1.2 Parametrization 188

1.3 Creating and using the configurations tree 188

1.4 Adding and manipulating configurations 189

1.5 Saving, loading and exporting the configurations tree 191

Bibliography **193**
