Introduction 1

1 Literature review 5

1.1 Model-based data-interpretation and prediction methods 5

1.1.1 Modelling and measurement uncertainties 6

1.1.2 Residual minimization 7

1.1.3 Bayesian model updating 8

1.1.4 Error-domain model falsification 11

1.1.5 Other data-interpretation methodologies 15

1.1.6 Limitations of existing data-interpretation methodologies 15

1.2 Parameter selection for structural identification 16

1.2.1 Information criteria for parameter selection 17

1.2.2 Stepwise-regression methods 17

1.2.3 Regularization for feature selection 18

1.2.4 Limitations of linear-regression-based methods 18

1.2.5 Model-based clustering for parameter selection 19

1.3 Multi-fidelity modelling for structural identification 21

1.4 Identification and predictions for full-scale structures 23

1.5 Conclusions 24

2 A Bayesian interpretation of model falsification 25

2.1 Introduction 25

2.2 Uncertainties in the model and its effect on model updating 26

2.3 Modified Bayesian model updating . . . 28
2.3.1 A box-car likelihood function for Bayesian model updating . . . 28
2.3.2 Compatibility with EDMF . . . 29
2.3.3 Robustness to correlation changes . . . 31
2.3.4 Sampling with uniform distributions . . . 32
2.4 Conclusions . . . 33

3 Model-Class Selection for Structural Identification and Prediction 35
3.1 Introduction . . . 35
3.2 Challenges in model-class selection for structural identification . . . 36
3.3 Methodology . . . 38
3.3.1 Understanding trends in model responses using clustering . . . 39
3.3.2 Classification to select parameters that explain the data . . . 41
3.3.3 Model-class selection using engineering judgement . . . 45
3.4 Example illustrating use of clustering and classification for parameter selection 47
3.5 Conclusions . . . 51

4 Multi-fidelity modelling for data-interpretation using EDMF 53
4.1 Introduction . . . 53
4.2 Model fidelity and model error . . . 54
4.3 Using surrogate models for EDMF . . . 55
4.4 Multi-fidelity framework for EDMF . . . 58
4.4.1 Combined uncertainties and falsification thresholds . . . 58
4.4.2 Iterative EDMF to improve precision . . . 60
4.5 Conclusions . . . 62

5 Applicability of EDMF in practise 63
5.1 Introduction . . . 63
5.2 Assessing accuracy of data-interpretation . . . 64
5.2.1 Assessing precision using leave-one-out cross-validation . . . 66
5.3 Adaptability to new information . . . 68
5.3.1 Including new information for EDMF . . . 69
5.3.2 Amenability to changes in prior distribution of model parameters . . . 71
5.3.3 Interpretability of identification results obtained using EDMF . . . 72
5.3.4 Computational complexity of grid sampling . . . 73
5.4 User-interface for practical application of EDMF . . . 73
5.4.1 Input files for the user-interface . . . 74
5.4.2 EDMF using the interface . . . 75
5.5 Conclusions . . . 78

6 Case studies 79
6.1 Introduction . . . 79
6.2 Venoge Bridge . . . 80

6.2.1 In-service measurements . . . 80
6.2.2 Development of a physics-based model . . . 82
6.2.3 Model class for identification . . . 83
6.2.4 Development of surrogate models . . . 85
6.2.5 Sources of uncertainty . . . 85
6.2.6 Structural identification using in-service measurements . . . 86
6.2.7 Remaining-fatigue-life estimation . . . 89
6.2.8 Computational cost . . . 93
6.2.9 Discussion . . . 94
6.2.10 Conclusions of the Venoge Bridge case-study . . . 96
6.3 Powder Mill Bridge . . . 97
6.3.1 Load test and monitoring . . . 98
6.3.2 Model development . . . 98
6.3.3 Model-class selection . . . 99
6.3.4 Structural identification of Powder Mill Bridge . . . 103
6.3.5 Using high-fidelity physics-based model to improve identification precision 107
6.3.6 Remaining fatigue life prediction . . . 108
6.3.7 Conclusions of the Powder Mill Bridge case-study . . . 110
6.4 Crêt de l'Anneau Bridge . . . 111
6.4.1 Finite-element-model development . . . 112
6.4.2 Model-class selection . . . 113
6.4.3 Uncertainty estimation for identification . . . 115
6.4.4 Structural identification of Crêt de l'Anneau Bridge . . . 115
6.4.5 Computational cost of identification . . . 120
6.4.6 Improving precision of identification using multi-fidelity modelling . . . 122
6.4.7 Reserve capacity estimation . . . 122
6.4.8 Conclusions of the Crêt de l'Anneau Bridge case-study . . . 124
6.5 Ponneri Bridge . . . 125
6.5.1 Development of a physics-based model . . . 125
6.5.2 Simulation of measurements . . . 126
6.5.3 Uncertainties in structural identification . . . 127
6.5.4 Structural identification of Ponneri Bridge before retrofit . . . 128
6.5.5 Structural identification of Ponneri Bridge after retrofit . . . 130
6.5.6 Interpretation of identification results . . . 132
6.5.7 Comparison of computational cost . . . 136
6.5.8 Conclusions of the Ponneri Bridge case-study . . . 140
6.6 Norton Bridge . . . 141
6.6.1 Development of a physics-based model . . . 142
6.6.2 Selection of model-class for identification . . . 142
6.6.3 Structural identification of Norton Bridge . . . 144
6.6.4 Reserve-capacity estimation with respect to serviceability limit state . . . 145
6.6.5 Conclusions of the Norton Bridge case-study . . . 146

6.7 General conclusions 147

7 Conclusions **149**
7.1 Modified Bayesian model updating 149
7.2 Model-class selection using clustering and classification 149
7.3 Multi-fidelity modelling for EDMF 150
7.4 Practical challenges in model-based data-interpretation 150
7.5 Case studies 150
7.6 Discussion and limitations 151
7.6.1 Data-interpretation methodologies 151
7.6.2 Estimation of uncertainties 152
7.6.3 Exploration of solution space 153
7.6.4 Clustering-classification method for model-class selection 154
7.6.5 Multi-fidelity modelling for EDMF 155
7.6.6 Practical challenges in data-interpretation 156

8 Future Work **157**
8.1 Evaluation of modelling uncertainties 157
8.2 Prognosis considering environmental and operational conditions 157
8.3 Exploration of solution spaces 158
8.4 Parameter selection 159
8.5 Linear regression-based surrogate modelling 160
8.6 User-interface for model-based data-interpretation 163
8.7 Consequences on design codes 164
