Abstract	ix
Zusammenfassung	xi
1 Introduction	1
1.1 Climate change in 2018	1
1.2 The global energy balance and climate change	2
1.3 Defining temperature extremes	4
1.3.1 Extreme indices	5
1.3.2 Heatwaves	6
1.4 Processes affecting the development of temperature extremes	6
1.4.1 Large-scale circulation	7
1.4.2 Land-atmosphere feedbacks	8
1.5 Observed temperature extremes	10
1.5.1 Recent extremes and trends	11
1.5.2 Human influence on temperature extremes	13
1.6 Projected changes in temperature extremes	14
1.6.1 Future changes and uncertainties	15
1.6.2 Observational constraints	17
1.7 Aims and outline	19
2 Regional amplification of projected changes in extreme temperatures strongly controlled by soil moisture-temperature feedbacks	21
2.1 Introduction	22
2.2 Models and Methods	24
2.2.1 Experiments	24
2.2.2 Extreme temperatures	25
2.2.3 Regions	25
2.3 Results	26
2.3.1 The role of soil moisture for projected changes in TXx	26
2.3.2 Regional amplification	27

2.3.3 Processes leading to regional amplification of temperature extremes	29
2.4 Conclusions	32
3 Varying soil moisture–atmosphere feedbacks explain divergent temperature extremes and precipitation projections in central Europe	35
3.1 Introduction	36
3.2 Data and Methods	38
3.2.1 CMIP5	38
3.2.2 GLACE-CMIP5	39
3.2.3 Observations	40
3.3 Results	40
3.3.1 Projected increase in TXx and divergent changes in summer precipitation	40
3.3.2 The role of changes in summer land and atmosphere variables	42
3.3.3 Soil moisture as driver for divergent summer precipitation in models?	44
3.3.4 Constraining: Which pathways are more realistic in projections?	46
3.4 Discussion	50
3.4.1 Feedbacks	50
3.4.2 Role of dynamics	54
3.4.3 The choice of the constraint	54
3.4.4 Future projections in Central Europe	55
3.5 Conclusions and Outlook	57
4 Global record-breaking 2018 heatwave due to human-induced climate change	59
4.1 Introduction	60
4.2 Results and discussion	60
4.2.1 Global-scale 2018 heat impacts	60
4.2.2 Record-breaking 2018 heatwave area	61
4.2.3 Human influence on the 2018 heatwave area	65
4.3 Methods	67
4.3.1 Heat-related impacts	67
4.3.2 Observation-based data	68
4.3.3 CMIP5 simulations	68
4.3.4 Study region	68
4.3.5 Definition of heatwave area	68
4.3.6 Attribution	69
4.3.7 Global mean temperature	69
4.4 Acknowledgements	70
5 Conclusions and outlook	71

Outlook	71
5.1 Conclusions	71
5.2 Discussion and Outlook	73
5.2.1 Future changes in hot extremes	73
5.2.2 Strength and limitations from idealized model experiments	75
5.2.3 Accelerated warming over land	77
5.2.4 Assessing multi-model ensembles	78
5.2.5 The global water cycle in CMIP5 models	79
5.2.6 Regional versus global climate models	80
5.2.7 Impact-relevant hot extremes	80
6 Appendix for Chapter 2	83
6.1 Discussion on ACCESS experimental set-up	83
6.2 Supplementary figures	84
6.3 Supplementary tables	91
7 Appendix for Chapter 3	93
7.1 Supplementary figures	93
7.2 Supplementary tables	96
8 Appendix for Chapter 4	97
8.1 Supplementary figures	97
8.2 Supplementary tables	100
Bibliography	100
Curriculum vitae	127
