1	Introduction	1
1.1	Motivation	1
1.2	Fundamentals on vibration in buildings	4
1.2.1	Influence of physical properties to the dynamic behaviour of a structure	7
1.2.2	Sources and receivers in buildings	9
1.2.3	Loading and moveable weights on floors	10
1.2.4	Standards and building codes	11
1.2.5	Human sensitivity to vibrations	13
1.2.6	Vibration of structures and transmissibility	16
1.3	Inertia-based vibration mitigation technologies - State of the art . . .	18
1.3.1	Passive dampers	19
1.3.2	Semi-active methods	21
1.3.3	Active methods	22
1.4	Implementation considerations for (active) vibration control	24
1.4.1	Vibration control methods	24
1.4.2	Location of the vibration control device	25
1.4.3	Device saturation	27
1.4.4	Actuator type	27
1.4.5	Power consumption	29
1.4.6	Behaviour in power failure situations	29
1.5	Conclusion	30
2	Modelling and Simulation	31
2.1	LTI systems	31
2.2	Dynamic behaviour of floor systems	32
2.3	One-degree-of-freedom dynamic systems	34
2.4	Multiple degrees-of-freedom dynamic systems	38
2.5	Inertia-based vibration control devices - the two degree-of-freedom model	41

2.5.1	General model	41
2.5.2	Passive damping devices	43
2.5.3	Semi-active damping devices	46
2.5.4	Active damping devices	47
2.6	System norms and energy	48
2.6.1	Signal norms	48
2.6.2	System norms	49
2.6.3	Energy	50
2.6.4	Mechanical energy balance and performance measurement	51
2.6.5	Energy transfer	52
2.7	Modelling errors and Sensitivity	53
2.8	Conclusion	53
3	Control strategies	55
3.1	State-of-the-Art control algorithms	57
3.1.1	Adaptive tuned mass damper (ATMD)	57
3.1.2	State feedback - Optimal Control	58
3.1.3	Direct Velocity feedback	62
3.1.4	Direct acceleration feedback	63
3.1.5	Negative acceleration feedback according to Nishimura	65
3.2	Novel control algorithms	68
3.2.1	Disturbance feedback control	69
3.2.2	Estimated Disturbance feedback control	70
3.2.3	Combined velocity feedback	72
3.2.4	Selective feedback controller	85
3.2.5	Fixed-order robust control by convex optimisation	87
3.2.6	Fixed-order control by genetic algorithm	92
3.3	Controller comparison	95
3.3.1	Damping performance and auxiliary stroke	96
3.3.2	Actuator force	98
3.3.3	Robustness	103
3.3.4	Performance and robustness for multi-resonances	106
3.4	Conclusion	106
4	Experimental Validation	113
4.1	Active TMD - improving the TMD	113
4.1.1	Implementation	113
4.1.2	Measurement equipment	116
4.1.3	Control architecture	117

4.1.4	Results and discussion	118
4.2	Active mass driver AMD - proof of concept	121
4.2.1	Implementation	121
4.2.2	Measurement equipment	122
4.2.3	Control architecture	123
4.2.4	Results and discussion	124
4.3	AMD - advanced design	127
4.3.1	Implementation of the AMD device	127
4.3.2	Implementation	131
4.3.3	Measurement equipment	131
4.3.4	Control architecture	133
4.3.5	Results and discussion	137
4.4	AMD - Implementation on a floor	141
4.4.1	Implementation	141
4.4.2	Measurement equipment	144
4.4.3	Control architecture	145
4.4.4	Results and discussion	145

5	Economic analysis	149
5.1	Active vibration control device - A cost analysis	149
5.1.1	AVCD construction costs	150
5.1.2	Maintenance and energy costs	150
5.2	Industry building 7.5x20.0m	150
5.3	Medium-rise office building	153
5.4	Conclusion	155

6	Conclusion	157
6.1	Summary of important findings	159
6.2	Limits of the application of active vibration control	159
6.3	Outlook and future work	160

Appendices	161	
A	Routh-Hurwitz Stability Criterion	161
B	Energy integral of an LTI-system	162
C	Integral-derivative of the cost function J	163
D	Vibrations of a Euler-Bernoulli beam	165
E	Controller	168

Bibliography	169
