

## Table of Contents

Abstract.....	ii
Abstrakt (auf Deutsch).....	iii
Table of Contents.....	iv
1 Introduction.....	1
1.1 Skin structures and functions.....	4
1.1.1 Keratinocytes and the epidermis.....	4
1.1.2 Fibroblasts, ECM fibers and the dermis.....	7
1.1.3 The hypodermis and intradermal adipocytes.....	9
1.1.4 Hair follicles and other skin appendages.....	11
1.1.5 Sensory neurons.....	15
1.1.6 Summary and section remarks.....	16
1.2 Cellular functions during wound healing.....	17
1.2.1 CELL ADHESIONS and CELL JUNCTIONS enable assembly of cells and ECM proteins.....	17
1.2.2 CELL MIGRATION supports accumulation of cells in the wound.....	20
1.2.3 CELL PROLIFERATION facilitates repopulation of cell-depleted wound tissues.....	24
1.2.4 CELL DIFFERENTIATION enables maturation of repopulating cells into functional tissues.....	27
1.2.5 PROTEIN SYNTHESIS enables production of new ECM tissues in the wound.....	29
1.2.6 CELL SIGNALING enables coordination of wound healing processes.....	33
1.2.7 Example: Rho GTPases Rac, Rho and CDC42 as key regulators of cell migration.....	37
1.2.8 Summary and section remarks.....	40

1.3 Tissue-level processes during wound healing.....	41
1.3.1 INFLAMMATION protects the wound environment and regulates proceedings steps of wound healing.....	41
1.3.2 REEPITHELIALIZATION enables restoration of barrier function.....	45
1.3.3 GRANULATION TISSUE FORMATION provides a provisional matrix for tissue repair.....	48
1.3.4 ANGIOGENESIS enables neovascularization of the damaged tissue ...	49
1.3.5 TISSUE REMODELING develops final tissue architecture.....	51
1.3.6 The wound microbiology requires careful consideration.....	53
1.3.7 Summary and concluding remarks.....	55
2 Engineering Biomimetic and Instructive Materials for Wound Healing and Regeneration.....	56
2.1 Regenerative mechanism in Nature.....	59
2.1.1 In urodele amphibians.....	59
2.1.2 In mice.....	60
2.1.3 In humans.....	63
2.1.4 Concluding remarks.....	65
2.2 Instructive Parameters for Biomaterial Design.....	66
2.2.1 ECM-biomimetic features.....	67
2.2.2 Biotic-abiotic integration interfaces.....	76
2.2.3 Morphogenic cues.....	80
2.3 Discussion and future perspectives.....	84
3 Production-scale fibronectin nanofibers promote wound closure and tissue repair in a dermal mouse model.....	88
3.1 Introduction.....	89
3.2 Results and Discussion.....	92
3.2.1 Synthetic fibrillogenesis of Fn nanofibers.....	92
3.2.2 In vitro fibroblasts activity.....	95

3.2.3	In vivo wound closure acceleration .....	97
3.2.4	Dermal and epidermal tissue architecture restoration.....	98
3.2.5	Dermal papillae and basal epithelial cell recruitment.....	101
3.2.6	Lipid layer restoration.....	103
3.2.7	Skin tissue architecture quality index .....	104
3.3	General Discussion and Conclusion.....	106
3.4	Materials and Methods .....	109
3.4.1	Protein nanofiber fabrication .....	109
3.4.2	Nanofiber diameter measurements .....	109
3.4.3	Protein structural integrity .....	110
3.4.4	Fn immunostaining .....	110
3.4.5	Fn FRET measurements.....	111
3.4.6	Cell culture protocol .....	111
3.4.7	In vitro assay .....	111
3.4.8	In vivo wound healing studies .....	112
3.4.9	Wound closure measurements .....	113
3.4.10	Tissue embedding and sectioning .....	113
3.4.11	Histological and immunofluorescent staining and imaging.....	114
3.4.12	Epidermal thickness quantification.....	116
3.4.13	Hair follicle and sebaceous gland quantification.....	117
3.4.14	ECM fiber alignment quantification.....	117
3.4.15	Adipocyte area coverage.....	117
3.4.16	Development of a Skin Tissue Architecture Quality (STAQ) index .....	118
3.4.17	Statistical analysis.....	119
3.5	Supplementary Figures.....	120
4	Tunable biomimetic hyaluronic acid and ECM protein nanofibers for pro-regenerative scaffold design.....	130

4.1	Introduction.....	131
4.2	Results and Discussion.....	134
4.2.1	Production-scale manufacture of biological polymer nanofibers using iRJS.....	134
4.2.2	Investigating and tuning fiber structure and mechanics .....	137
4.2.3	Highly porous HA scaffolds enable direct cellular infiltration.....	140
4.2.4	Accelerated tissue integration through increased scaffold porosity .....	142
4.2.5	Porous HA scaffold reduces scar formation .....	144
4.3	Discussion and Conclusion .....	146
4.4	Materials and Methods.....	148
4.4.1	Design of production-scale iRJS system.....	148
4.4.2	Protein solution preparation and spinning .....	148
4.4.3	Scaffold dehydration, lyophilization and cross-linking.....	150
4.4.4	Scanning electron micrography (SEM) and characterization of fiber size and scaffold porosity.....	151
4.4.5	Rheology measurements .....	151
4.4.6	X-ray micro-computed tomography ( $\mu$ CT) .....	152
4.4.7	Fourier transform infrared spectroscopy (FTIR) .....	152
4.4.8	Swelling ratio and degradation kinetics.....	153
4.4.9	Mechanical testing .....	153
4.4.10	In vitro cell infiltration studies.....	153
4.4.11	In vivo wound healing studies .....	154
4.4.12	Histological analysis .....	155
4.4.13	Statistical analysis.....	155
4.5	Supplementary Figures.....	156
5	Conclusion .....	162
6	Bibliography .....	164
7	Funding Sources.....	197

8	Acknowledgments.....	198
9	Curriculum Vitae .....	199
